Authors: Paul Ziemkiewicz, Aaron Noble, David Hoffman

#### What are Critical Minerals

- The Secretary of the Interior defined a list of 50 critical minerals through the USGS in 2022
- Of these critical minerals 17 are considered rare earth elements
  - Can be split into heavy and light rare earth elements
- Final list published by Secretary of Energy in 2023 defining critical and near critical elements in the short term and medium term.

# Why are Critical Minerals so important to the United States?

- United States relies on several rare earth elements and critical Minerals for use in manufacturing national defense related items
- Realized fears of China cutting supply to the United States
- Department of Defense Federal Acquisition Regulations (DFAR) require some CM's and REE's be obtained through "covered" countries by December 2026.
  - Will require sources are obtained outside of China
- Several other US based manufactures of automobiles, medical devices, magnets, etc. rely upon China's critical minerals to manufacture parts and stay in business.

#### The Significance of REE in AMD

- 45% distribution of critically needed heavy rare earth elements
  - Mountain Pass REE mine has primary distribution of light rare earth elements
- Consistent distribution of heavy rare earth elements in acid mine drainage across the United States.
- \*1 t/day REE separation facility using AMD feedstocks could generate 7-8% of worlds Tb/Dy supply
  - \*Projections indicate by 2030 only 50% of Tb/Dy demand will be met with current suppliers

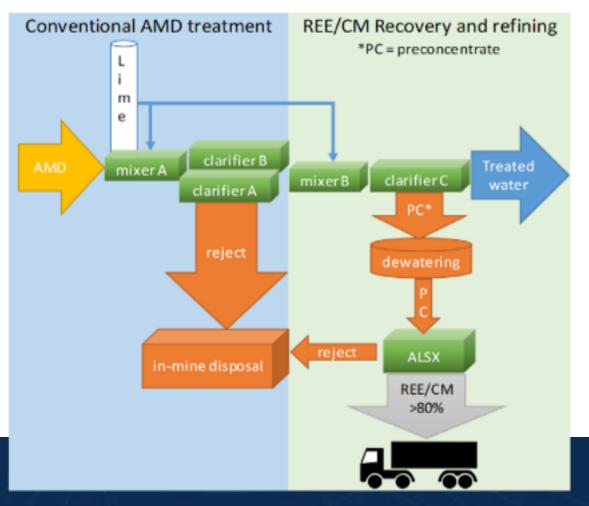

\*Source: Adamas Intelligence

### An Environmentally Benign and Cost-Effective Solution

- In 2017 WVVWRI developed a two-stage treatment to generate a REE feed stock
  - Many AMD treatment facilities can be easily converted to REE/CM recovery
  - Need 2 clarifiers with independent pH controls
  - WVWRI method meets water compliance criteria
  - Capture of HPC decreases
    sludge disposal cost

\*Note: Not Independently controlled

West Virginia University. West Virginia WATER RESEARCH INSTITUTE

#### **Revenue Background**

- Contained Value (CV) is the market price on an oxide basis of elements of value in feedstocks
- Note: REE Prices in 2022 are extremely depressed
- Revenue is calculated as 20% of the CV
  - Accounts for costs of midstream and downstream refining of pre-concentrates to generate CM and REE products
- Revenue does <u>not</u> account for costs incurred by the treatment operator to build or operate a facility

West Virginia University. West virginia WATER RESEARCH INSTITUTE

|    |                           | Unit Price |               |  |

| Contained Value    | \$ 267,100.42             | \$ 99,959.54 | \$ 158,718.66     |
| Revenue            | \$ 53,420.08              | \$ 19,991.91 | \$ 31,743.73      |

Note: Ga, Ge, and other critical minerals not included in revenue calculations due to inability to get accurate analytical data

## A34 Buffalo Coal Permit Case Study

## A34 Background

- 500 gpm active AMD treatment plant located near Mt.Storm WV
- On the former Buffalo coal permit
- WVDEP required to meet NPDES discharge permit
- Formerly a passive lime dose and settling pond treatment site
- Active treatment required to meet discharge permit regardless of REE plant
- WVDEP and WVWRI partnered in 2020 to build AMDREE capture facility

# Site A34 Conventional treatment vs AMDREE costs

- Chemical cost remain unchanged due to similar discharge pH requirements
- Under optimal scenario only 2 clarifiers are installed to eliminate large amount of additional CAPx
- Revenue is based upon 2022 pricing
- Ga and Ge is not included in revenue but is found in MREO products.
  - Could add a minimum of \$6,000 in revenue annually

### **CAPx considerations and lessons learned**

- Only two independently pH-controlled clarifiers are needed
  - WVDEP currently designs all facilities with at least two clarifiers
  - REE capture can be shut down for high flow seasons that only occur a few weeks per year
- CAPx at A34 is increased due to pour in place vs oversized clarifiers
  - Richard costs were decreased due pre-cast construction and shortened clarifier length
- CAPx at Richard increased due to designing REE plant after groundbreaking of conventional facility

### **OPx lessons learned**

- By recovering REE enriched pre-concentrates, sludge disposal costs can decrease by 50%
  - Varies by site due to type of disposal
- Rare Earth price variability can greatly impact revenue
  - I.E. Terbium and Dysprosium prices have doubled since January 1<sup>st</sup> 2025 but can also rapidly decline in price due to Chinese market manipulation
- Flow and critical mineral water concentration also greatly affects Opx and Revenue
  - I.E. Richard has similar flow to A34 but produces 1/3 the products due to geological location of facility

#### **Theoretical Optimal AMDREE treatment vs conventional treatment on Greens Run Watershed**

- CAPx increase due to both land acquisition and additional pipeline installation for watershed scale treatment
- REE/CM watershed has decreased concentration in water leading to less revenue
- CAPx increase for REE vs conventional facility minimal

| Greens Run Water Shed Treatmetn Plant (preliminary) |              |           |  |  |  |  |

#### **Roadblocks to REE recovery from AMD**

- Unstable critical mineral market inhibits United States investment in separation technologies
  - China has ability to crash market at any time
- Lack of individuals educated in critical mineral recovery in United States
  - No official university programs in United States
  - China has ~40 university programs for critical mineral and rare earth element recovery
- Lack of policy regarding mineral ownership from waste feedstocks in United States
- Lack of existing REE enriched feedstock to encourage construction of midstream separation facility

### WVWRI's Future REE Development

- Continued partnerships with government agencies to find sources of REE and CMs in other waste feeds
- Continue to build partnerships with industry partners to find both sources of REE and CM's, and find environmentally benign solutions to treating waste streams
- Scale up AMD treatment to restore watersheds while recovering REE/CM
- Develop further separation technologies for critical minerals and REE elemental separation
- Encourage and support government policy for treatment operator REE/CM ownership in U.S. and for protection of REE/CM pricing in U.S. to prevent Chinese price crashing

West Virginia University. West virginia Water research institute

### Conclusions

- AMDREE recovery has minimal CAPx cost increases if additional clarifiers are not added to the treatment system
- Operational cost savings from 16 to 30+% can be obtained through REE revenue and decreased sludge disposal costs
  - Future cost savings could improve based upon REE market
- Ideally existing systems with independent pH controls would be modified to capture REE and CM products without high capital investment.
- Constructing a new conventional treatment system does not provide justifiable cost savings over AMDREE treatment
